The peptides of the invention have: (a) cytolytic activity on CC invention. The peptides of the invention have: (a) cytolytic activity on CC the body); but (b) no haemolytic activity, or such activity only at a concentration significantly higher than that at which they lyse pathogens. The peptides, their complexes and mixtures are used to treat CC infections (caused by bacteria, fungi, protozoa, mycoplasma or viruses) or cancer; in human and veterinary medicine. Also, they can be used as agricultural pesticides. The absence of haemolytic activity (associated CC with disturbance of alpha-helical structures) means that the peptides thave few if any toxic effects, and those that include D-aa will have concreased resistance to proteolytic degradation. Nor haemolytic, cytotoxic random copolymers of pardaxin, each has a specific spectrum of activity, allowing selection of agents for particular applications. Since these random copolymers induce total lysis of bacterial cell walls, corresistance to them is unlikely to develop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match 100.0%;

                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a Leu/Lys diastereomer peptide of the invention. The peptides of the invention have: (a) cytolytic activity on the peptides of the invention have: (a) cytolytic activity on pathogenic cells (pathogens and malignant cells not naturally present in the body); but (b) no haemolytic activity, or such activity only at a concentration significantly higher than that at which they lyse pathogens. The peptides, their complexes and mixtures are used to treat infections (caused by bacteria, fungi, protozoa, mycoplasma or viruses) or cancer, in human and veterinary medicine. Also, they can be used as preservatives for food, cosmetics and agricultural produce, or as agricultural pesticides. The absence of haemolytic activity (associated with disturbance of alpha-helical structures) means that the peptides have few if any toxic effects, and those that include D-aa will have chose that include T-activity allowing selection of agentastion. Non-haemolytic, cytotoxic random copolymers of pardaxin, each has a specific spectrum of activity, allowing selection of agents for particular applications. Since these random copolymers induce total lysis of bacterial cell walls, resistance to them is unlikely to develop.
                                                                                                                                                                                                                                                                                                                 Query Match

The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, including bacterial, fungal, viral, mycoplasma and protozoan infections. They may be used in both human and veterinary medicine. They may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present peptide is used to produce the agents of the invention. The specification describes a non-haemolytic, cytolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random peptide copolymer. The agent has a selective cytolytic activity on pathogenic cells. The agent is selected from a cyclic derivative of a pathogenic cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New non-haemolytic cytolytic agent useful in treating cancer infections - is a peptide comprising a moiety which disrupts continuity of an alpha-helical structure

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present peptide is used to produce the agents of the invention. The CC specification describes a non-haemolytic, cytolytic agent, which is a CC peptide, a complex of bundled peptides, a mixture of peptides or a random CC peptide copolymer. The agent has a selective cytolytic activity on CC pathogenic cells. The agent has a selective cytolytic activity on CC peptide which has a net positive charge greater than 1, comprises L-amino CC acid residues and/or D-amino acid residues and comprises an alpha-helix CC breaker molety, or a peptide (or cyclic derivative of this) which CC (comprises L-amino acid residues and D-amino acid residues, has a net CC (comprises L-amino acid sequence such that a corresponding amino acid sequence comprising only L-amino acid residues is not found in nature. The cytolytic agents may be used for treatment of concer or for treatment of several diseases caused by pathogens, CC including bacterial, fungal, viral, mycoplasma and protozoan infections. They may be used in both human and veterinary medicine. They may also be used as disinfectants for destruction of microorganisms, i.e. in CC cosmetic and food industries, as preservatives, e.g., in the CC cosmetic and food industries, as pesticides (e.g. fungicides or cCC bactericides) or for preservation of agricultural products.

The present peptide is used to produce the agents of the invention. The CC specification describes a non-haemolytic, cytolytic agent, which is a CC peptide, a complex of bundled peptides, a mixture of peptides or a random CC peptide copolymer. The agent has a selective cytolytic activity on pathogenic cells. The agent has a selected from a cyclic derivative of a comprises L-amino acid residues and/or D-amino acid residues and comprises un alpha-helix cc peptide which has a net positive charge greater than 1, comprises L-amino acid residues and comprises an alpha-helix cc comprises L-amino acid residues and D-amino acid sequence such that c comprises L-amino acid residues an amino acid sequence such that c a corresponding amino acid sequence comprising only L-amino acid residues are consitive charge greater than 1 and has an amino acid sequence such that a corresponding amino acid sequence comprising only L-amino acid residues is not found in nature. The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, cincluding bacterial, fungal, viral, mycoplasm and protozoan infections. They may be used in both human and veterinary medicine. They may also be used as disinfectants for destruction of microorganisms, i.e. in solutions for wetting contact lenses, as preservatives, e.g., in the cosmetic and food industries, as pesticides (e.g. fungicides or bactericides) or for preservation of agricultural products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ρ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC fc domain, pharmacologically active peptides, and linkers. Where (I) is:

CC (X1)a+F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each

CC independently selected from -(L1)c-P1 -(L2)d-P2 -(L2)d-P2.

CC (L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4

CC where P1, P2, P3, and P4 = are each independently sequences of

CC pharmacologically active peptides; L1, L2, L3, and L4 = are each independently

CC independently linkers; and a, b, c, d, e, and f = are each independently

CC or 1, provided that at least 1 of a and b is 1. The composition can

CC have cytostatic, antiasthmatic, thrombolytic and immunosuppressive

CC activities. DNAs, vectors and host cells from the present invention can

CC useful for treating cancer, asthma, thrombosis, or autoimmune diseases.

CC The use of an Fc domain (rather than a Fab domain) can provide a longer

CC half-life or incorporate functions such as Fc receptor binding, protein

CC h binding, complement fixation, and possibly placental transfer. AAA69443

CC concerned with the examplification of the present invention acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes composition of matter (I) comprising an CC (XI)a-F1-(X2)b, where: F1 = an Fc domain, X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (CC -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (CC where P1, P2, P3, and P4 = are each independently sequences of comparation of the peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently contained that at least 1 of a and b is 1. The composition can composition are contained for producing pharmaceutical compositions. The compositions are considered for producing pharmaceutical compositions. The compositions are consequenced for producing pharmaceutical compositions. The compositions are consequenced for producing pharmaceutical compositions of the use of an Fc domain (rather than a Fab domain) can provide a longer lalf-life or incorporate functions such as Fc receptor binding, protein a hinding, complement fixation, and possibly placental transfer. AAA69443 cc sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Best Local Similarity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC sequence represents a diastereomer peptide of the invention. This CC sequence is used in a "bundle sequence", which is created by binding 5 CC copies of this sequence to peptide 23 (see ANM3514). The peptides of CC copies of this sequence to peptide 23 (see ANM3514). The peptides of CC and malignant cells not naturally present in the body; but (b) no CC haemolytic activity, or such activity only at a concentration CC significantly higher than that at which they lyse pathogens. The CC peptides, their complexes and mixtures are used to treat infections CC (caused by bacteria, fungi, protozoa, mycoplasma or viruses) or cancer, CC in human and veterinary medicine. Also, they can be used as preservatives CC for food, cosmetics and agricultural produce, or as agricultural CC disturbance of alpha-helical structures) means that the peptides have few CC disturbance of alpha-helical structures) means that the peptides have few CC if any toxic effects, and those that include D-aa will have increased CC resistance to proteolytic degradation. Non-haemolytic, cytotoxic random CC copolymers of pardaxin, each has a specific spectrum of activity. Callowing selection of agents for particular applications. Since these CC random copolymers induce total lysis of bacterial cell walls, resistance CC for them is untilkely to develow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fc domain, pharmacologically active peptides, and linkers. Where (I) is:

(Xl)a-Fl-(X2)b, where: Fl = an Fc domain; Xl and X2 = are each

independently selected from -(Ll)c-Pl, -(Ll)d-Pl-(L2)d-P2.

(Ll)c-Pl-(L2)d-P2-(L3)e-P^3, or -(L1)c-Pl-(L2)d-P2-(L3)e-P3-(L4)f-P4

where Pl, P2, P3, and P4 = are each independently sequences of

pharmacologically active peptides; Ll, L2, L3, and L4 = are each independently

clindependently linkers; and a, b, c, d, e, and f = are each independently

clindependently linkers; and a, b, c, d, e, and f manunosuppressive

activities. DNAs, vectors and host crells from the present invention can

be used for producing pharmaceutical compositions. The compositions are

useful for treating cancer, asthma, thrombosis, or autoimmune diseases.

The use of an Fc domain (rather than a Fab domain) can provide a longer

half-life or incorporate functions such as Fc receptor binding, protein

A binding, complement fixation, and possibly placental transfer. AAA6943

to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cancer or for treatment of several diseases caused by pathogens, including bacterial, fungal, viral, mycoplasma and protozoan infection They may be used in both human and veterinary medicine. They may also used as disinfectants for destruction of microorganisms, i.e. in solutions for wetting contact lenses, as preservatives, e.g., in the cosmetic and food industries, as pesticides (e.g. fungicides or bactericides) or for preservation of agricultural products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   acid residues and/or D-amino acid residues and comprises an alpha-helix breaker modety, or a peptide (or cyclic derivative of this) which (comprises L-amino acid residues and D-amino acid residues, has a net positive charge greater than 1 and has an amino acid sequence such that a corresponding amino acid sequence comprising only L-amino acid residues is not found in nature. The cytolytic agents may be used for treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                specification describes a non-haemolytic, cytolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random peptide copolymer. The agent has a selective cytolytic activity on pathogenic cells. The agent is selected from a cyclic derivative of a peptide which has a net positive charge greater than 1, comprises L-amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New non-haemolytic cytolytic agent useful in treating cancer or infections - is a peptide comprising a moiety which disrupts the continuity of an alpha-helical structure

The peptides AAW77376-W77390 can be modified by the method of the invention by substituting at least one amino acid of the peptide to provide a peptide having at least one amino acid which is modifiable by a reaction and replacing other amino acids in the peptide with amino acids which are not modifiable by the reaction. The methods can be used for the modification of biologically active peptides such as hormones, toxins and peptides which act on lipid bilayer membranes. The modified peptides can be used e.g. in the body of an animal or plant or parts in order to affect the structure or integrity or permeability of a foreign body such as a microorganism, parasite or virus present in the body of the animal or plant or within the cells of the body of the animal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             W09837090-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Synthetic
specification describes a non-haemolytic, cytolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random peptide copolymer. The agent has a selective cytolytic activity on pathogenic cells. The agent is selected from a cyclic derivative of a pathogenic cells. The agent is selected from a cyclic derivative of a cid residues and/or D-amino acid residues and comprises in alpha-helix breaker moiety, or a peptide (or cyclic derivative of this) which because L-amino acid residues and D-amino acid residues, has a net positive charge greater than 1 and has an amino acid sequence such that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New non-haemolytic cytolytic agent useful in treating cancer infections - is a peptide comprising a moiety which disrupts continuity of an alpha-helical structure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   19-FEB-1998;

            The present peptide is used to produce the agents of the invention. The CC specification describes a non-haemolytic, cytolytic agent, which is a CC peptide, a complex of bundled peptides, a mixture of peptides or a random CC peptide copolymer. The agent has a selective cytolytic activity on CC peptide which has a net positive charge greater than 1, comprises L-amino CC peptide which has a net positive charge greater than 1, comprises L-amino CC peptide which has a net positive charge greater than 1, comprises In-alpha-helix CC acid residues and/or p-amino acid residues and comprises an alpha-helix (comprises I-amino acid residues and D-amino acid residues, has a net CC positive charge greater than 1 and has an amino acid sequence such that CC positive charge greater than 1 and has an amino acid sequence such that CC is not found in nature. The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, concluding bacterial, fungal, viral, mycoplasma and protozoan infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               a corresponding amino acid sequence comprising only L-amino acid residues is not found in nature. The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, including bacterial, fungal, viral, mycoplasma and protozoan infections. Including be used in both human and veterinary medicine. They may also be used as disinfectants for destruction of microorganisms, i.e. in solutions for wetting contact lenses, as preservatives, e.g., in the cosmetic and food industries, as pesticides (e.g. fungicides or bactericides) or for preservation of agricultural products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAW82859 standard; peptide; 77
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Non-haemolytic; cytolytic; selective cytolytic activity; pathogen; cancer; infection; disinfectant; contact lens wetting solution; preservative; pesticide; fungicide; bactericide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            19-MAY-1999

Bacteriol. 176:6572-6582(1994).

-I- FUNCTION: THE SIGNA FACTOR IS AN INITIATION FACTOR THAT PROMOT ATTACHMENT OF THE RNA POLYMERASE TO SPECIFIC INITIATION SITES THEN IS RELEASED. THIS SIGNA FACTOR IS RESPONSIBLE FOR THE EXPRESSION OF SPORULATION SPECIFIC GENES (BY SIMILARITY).

-I- SIMILARITY: BELONGS TO THE SIGNA-70 FACTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SEQUENCE FROM N.A.

T genome by two-dimensional gel-electrophoretic analysis.";

T Nucleic Acids Res. 21:4816-4823(1993).

C -!- FUNCTION: RNaseP catalyzes the removal of the 5'-leader sequence

from pre-tRNA to produce the mature 5'terminus. It can also

c cleave other RNA substrates such as 4.55 RNA. The protein

C cleave other RNA substrates such as 4.55 RNA. The protein

C component plays an auxiliary but essential role in vivo by bindi

c to the 5'-leader sequence and broadening the substrate specifici

C of the ribozyme (By similarity).

C -!- CATALYTIC ACTIVITY: Endonucleolytic cleavage of RNA, removing 5'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
